

Project Description

BrightTV User Profile and Viewership Analysis

The BrightTV User Profile and Viewership Analysis project was undertaken to support the company's goal of increasing subscriptions, improving customer engagement, and enhancing the overall streaming experience. As competition within the digital streaming industry continues to grow, understanding customer behaviour has become essential for making informed business decisions and maintaining a competitive advantage.

To ensure the accuracy and reliability of the analysis, the raw datasets underwent a comprehensive data cleaning and preparation process before any analysis was performed. This involved removing duplicate records, handling missing values, correcting inconsistent data entries, standardising formats across multiple fields, and creating new calculated attributes such as watch date, watch time categories, day classifications, month names, and viewing time intervals. These transformations improved data quality and ensured that the results reflected meaningful customer behaviour.

Once the data was prepared, exploratory data analysis was conducted to examine customer demographics, viewing patterns, subscription behaviour, device usage, and content preferences. The analysis focused on identifying trends, peak viewing periods, popular genres, customer segments, and factors that influence user engagement.

The findings from this project provide valuable insights that can assist BrightTV in understanding its customers, improving content strategies, optimising marketing campaigns, increasing subscriber retention, and supporting data-driven business decisions. By transforming raw data into actionable insights, this project demonstrates how analytics can be used to improve operational performance and contribute to long-term business growth.

Key Objectives

- Clean and prepare the user profile and viewership datasets to ensure data quality.
- Analyse customer demographics to better understand BrightTV's audience.
- Identify viewing patterns, peak viewing periods, and popular content genres.
- Evaluate subscription and engagement trends.
- Generate actionable insights and recommendations that support the CEO's objective of increasing subscriptions, improving customer engagement, and driving sustainable business growth.
